योग पूर्व पृष्ठ

प्रश्न क्र.

Ans. of Q.1.

- (i) Endometrium
- (ii) Ampullary region (Fallopian tube)
- (iii) Gregor J. Mendel
- (iv) drug (bhavas, yanija). Cannabinoids
- (v) Upright type
- (vi) false fruit
- (vii) Polyembryony

U  
S  
E

Ans. of Q.2.

- (i) Rosie is the yeast transgenic cow
- (ii) Transcription
- (iii) Rheumatoid Arthritis
- (iv) Widal Test

प्रश्न क्र.

(v) Death rate (Mortality).

(vi) The Hotspots of India → Himalaya, western ghats of Sri Lanka, Indo-Burma.

(vii) Restriction enzyme (Endonuclease & Exonuclease) are known as molecular scissors.

**B** Ans of Q. 3.

**S**

(i) Consumer.

(ii) stem cell.

(iii) Sutton and Boveri.

(iv) Bacillus thuringiensis.

(v) Dormancy.

(vi) Lactobacillus.

(vii) Tapetum.

प्रश्न क्र.

Ans. of Q. 4.

S  
S  
E

A.	B.
(i) Ex-situ Conservation.	Zoological parks.
(ii) Sunken stomata.	Adaptation.
(iii) Entamoeba.	Amoebiasis.
(iv) Gel electrophoresis	Separation of DNA fragment.
(v) Penicillin.	First Antibiotic.
(vi) Thalassaemia.	Recessive gene blood disease.
(vii) Turner's Syndrome.	Absence of 1 X-chromosome

Ans of Q. 5. (oh)

Homozygous	Heterozygous.
(i) They have similar pair of Allele. eg. → TT, tt.	(i) They have dissimilar pair of allele. eg → Tt.

(ii) They produce one type of gamete.

(ii) They produce two types of gametes.

(iii) They possess either dominant or recessive.

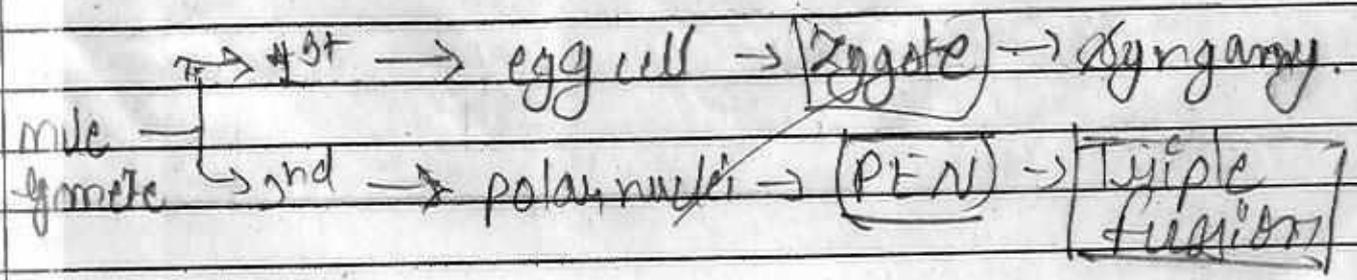

(iii) They have both dominant and recessive.

Ans of Q.6.

B  
S  
E

Triple fusion → It is a step of Double fertilisation.

When fertilisation occurs two male nuclei are released in embryo sac in which one is fused with polar egg cell and form zygote while the other fuse with two polar nuclei located in the central cell which result in the formation of triploid (EN) (Primary Endosperm Nucleus) which later convert into PEC. Hence, the fusion of three haploid nuclei, the process is called Triple fusion.

Ans of Q. 7.

Parturition → The period of pregnancy is called gestation period. At the end of the gestation period, vigorous contraction by uterus cause expulsion or the delivery of the foetus. This delivery of foetus or childbirth is called parturition.

This phenomenon is induced by complex neuroendocrine gland. Oxytocin is the hormone released during parturition.

Ans. of Q. 8. (OR)

Disease	Caused by
(i) AIDS	HIV
(ii) Syphilis	<i>Treponema pallidum</i>
(iii) Chlamydia	Chlamydia
	Trachomonitis.

7

प्रश्न क्र.

Ans. of Q.9.

BOD → BOD stands for Biological Oxygen Demand.

BOD is refers to the amount of oxygen that consumed by aerobic bacteria in the formation of organic matter by oxidising the given sample of waste water.

The greater the BOD, the greater the water has polluting capacity.

It is affected only in secondary treatment of sewage.

Ans. of Q.10.

Cloning → It is the result of asexual reproduction. The process in which single parent individual produce is offspring.

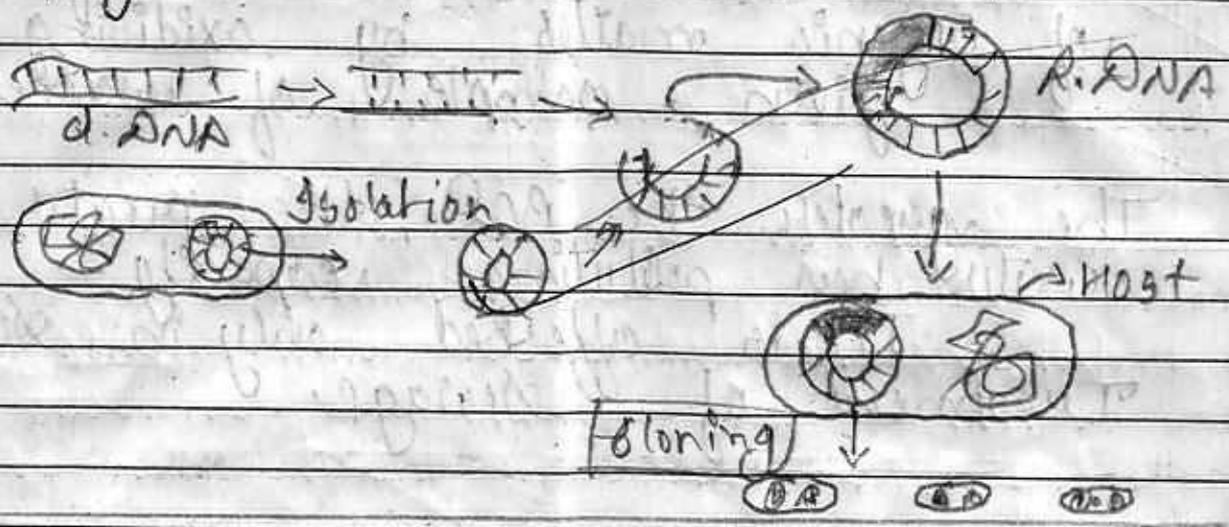

Cloning → The process in which Recombinant DNA (vector + foreign DNA) is inserted into the host cell, which reproduce rapidly.

E  
S  
E

with which the foreign DNA also copied, produce the desired product is called cloning.

It is the process in which in which we can obtain desired DNA in large quantity by small segment.

B  
S  
E

Ans of Q. 11.

→ Causes of AIDS. →

(i) It may transfer through sexual contact with infected person.

(ii) Transfusion of contaminated blood with blood of normal patient.

- (ii) The child which born by infected mother.
- (ii) By sharing of needles.

Ans. of Q. 12. (or)

→ The nitrogenous bases found in RNA are :-

- |               |     |                   |
|---------------|-----|-------------------|
| i) Adenine    | } → | <u>purin</u> .    |
| ii) Guanine   |     |                   |
| iii) Cytosine | } → | <u>pyridine</u> . |
| iv) Uracil    |     |                   |

in which ; Adenine attached to

Ans. of Q. 13

Test Cross → The cross of  $F_1$  generation with with recessive parent is called Test Cross.

(or)

The cross made to know whether the given phenotype dominant is homozygous or heterozygous, offspring of  $F_1$  generation which with

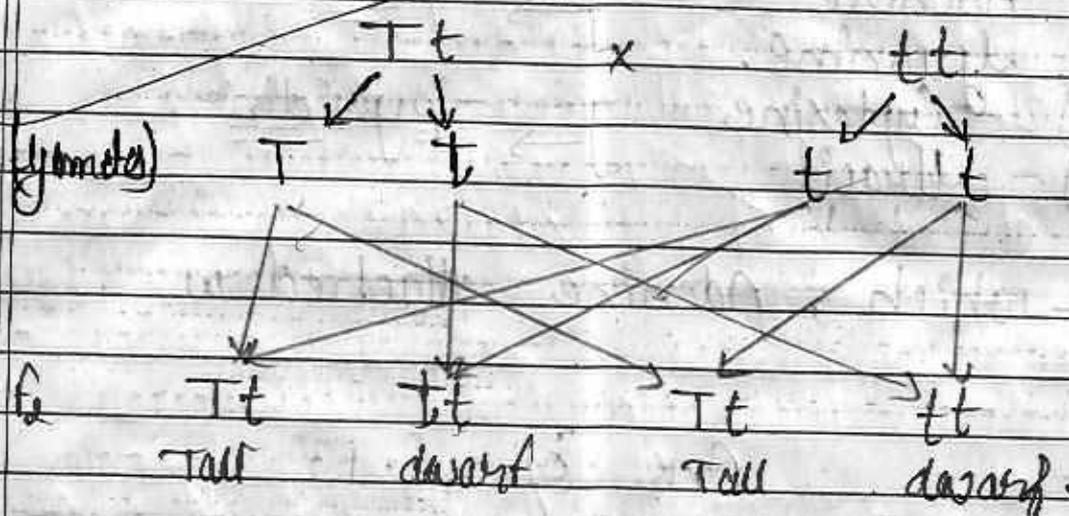

Recessive parent are crossed, is known as Test cross.

Diagrammatic Representation.

cross of  $Tt$  with recessive parent  $tt$ .

USE

Phenotype  $\rightarrow$  Tall : Dwarf = 2 : 2  
 Genotype  $\rightarrow$   $Tt : tt = 2 : 2$

Hence, the given  $Tt$  phenotype is heterozygous.

 अंश 14.

The measures useful for prevention & control of drug and alcohol use-

1) Avoid undue peer pressure → One should avoid the unnecessary pressure by elders or family for anything such as job and being self-dependent etc.

(i) Education and Counselling :- One should have aware about problem and have knowledge of health problem by alcohol and drug.

(ii) Seeking help from parent and peers → If one get addict to drug or alcohol, should have to talk with parent and take their help and suggestion.

(iii) Seeking help of professional or medicinal → the person should consult the professional or medicinal expert.

(iv) Look for danger signals.

Ans. of Q.15. (05)

Decomposition → The process in which complex organic matter is broken down in simple inorganic matter by decomposers, like,  $H_2O$ ,  $CO_2$  etc, is called Decomposition.

It is a largely oxygen requiring process. The dead organic matter used by decomposers is called Detritus.

B  
S  
E

\* Decomposition involve following process:-

- (1) Fragmentation, (2) Leaching, (3) Catabolism
- (4) Humification (5) Mineralisation

(1) Fragmentation → Detritus breakdown by detritivorous into simple small particle.

(2) Leaching → The insoluble salt precipitate in soil with help of  $H_2O$ .

(3) Catabolism → Bacterial & fungal enzymes

प्रश्न क्र.

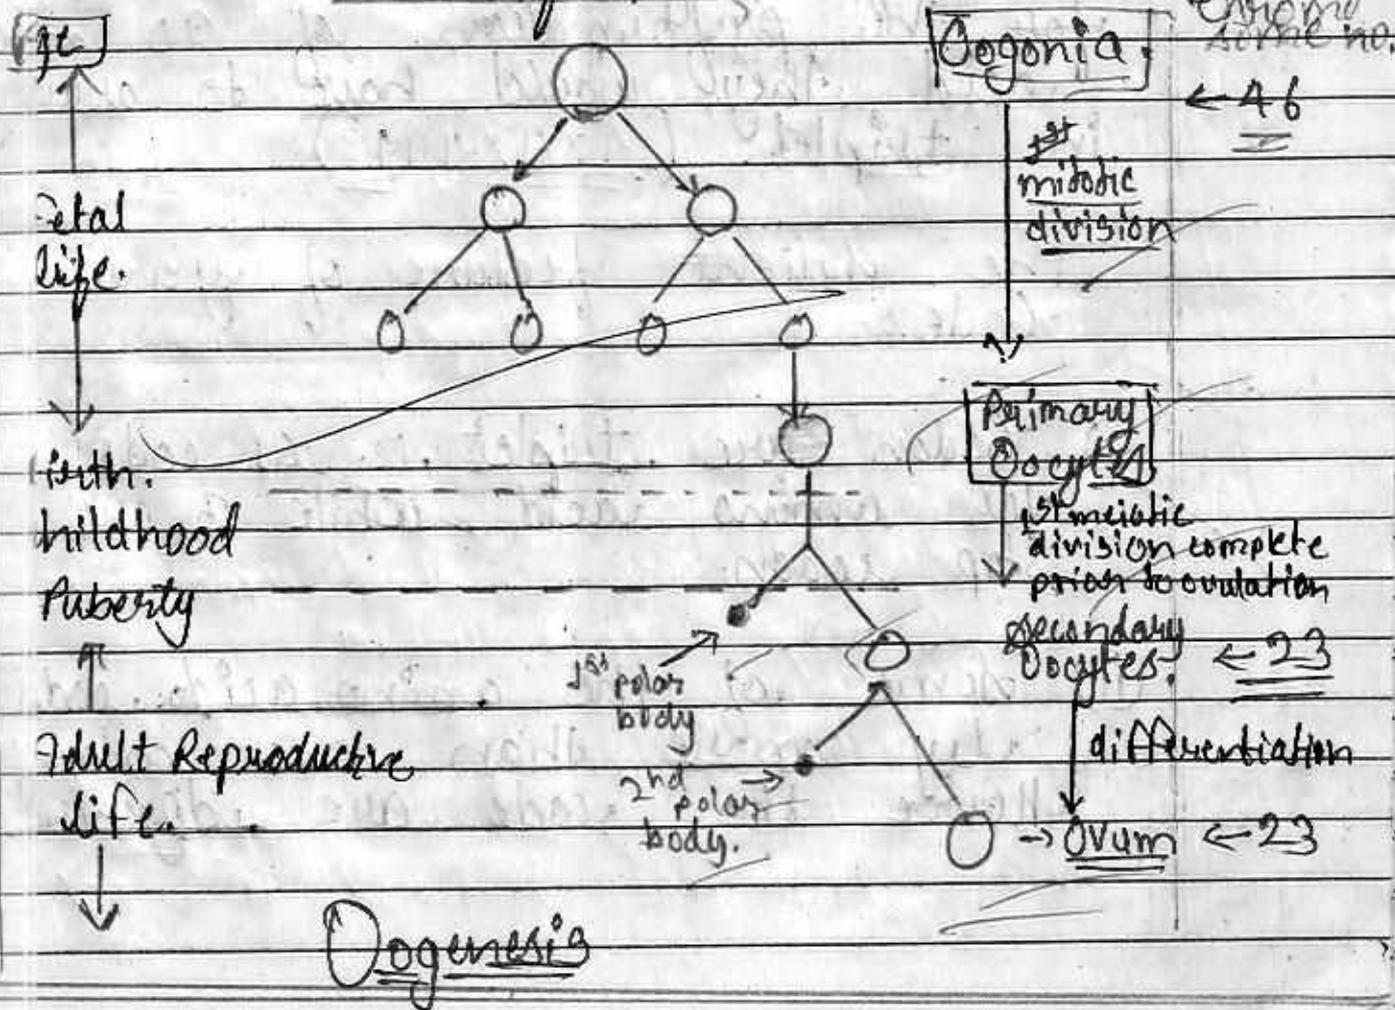

further degrade it-

(4) Humification → It leads to the formation of black-colored amorphous substance called humus.

(5) Mineralisation → The humus further degrade by microbe and the nutrient get mix into soil.

B  
S  
E

Ans. of Q.16.

14

प्रश्न 1.

Analysis of Q. 17.

Genetic Code  $\rightarrow$  Nucleotide triplet which are responsible for protein or amino acid formation are called genetic code.

The code is made up of three nucleotide called codon

It was first argued by George Gamow that there are four types of nucleotide, and for the formation of 20 amino acid they would have to arrange in triplet.  $(4 \times 4 \times 4) (4^3)$

The salient feature of genetic code is:-

(i) Codon are triplet, i.e. 64 code for amino acid while 3 are stop codon.

(ii) Some of the amino acids codes by more than one codon. Hence the code are degenerate.

15

[ ] + [ ] =

APPO

कुल अंक

प्रश्न क्र.

(ii) The codon are read by mRNA in contiguous fashion, i.e. without any punctuation.

(v) The codon are universal, means the it codes for same amino acid in all organism.

(vi) AUG has a dual nature - it codes for methionine as well as initiation codon.

(vii) UAA, UGA and UAG are stop codon and does not code for any amino acid.

Any Ans. of Q. 18 (or).

Ecological Succession → The gradual and fairly predictable changes in species composition in an given area is called ecological succession.

प्रश्न 3

The succession of different communities on the bare rock is known as Xerarch.

Ex → The lichen which first invades on the bare rock leads to the degradation of rock to soil in several thousands of years, small grass start to grow in such area for some years then leads to the perennial grass and then shrubs. The last community nearly in equilibrium is the forest or tall trees.

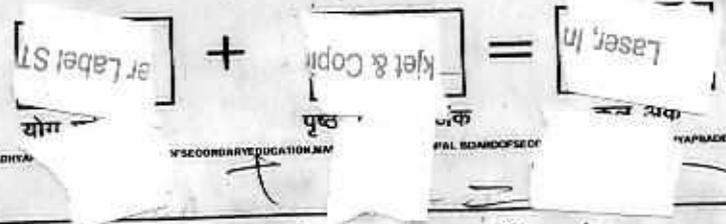

B  
S  
E

In ecological succession changes take by the communities named →

- (i) pioneer community
- (ii) seral stage or seral community
- (iii) climax community

(i) Pioneer community → The first community that invades the bare rock

17

and turn them into soil in several thousands of years called pioneer community.

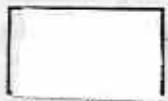

(ii) Seral Community → The transitional community between pioneer and climax community is called Seral Community.

(iii) Climax Community → The final community that is in equilibrium with environment and does not change is called Climax Community.

Sere → The entire sequence of community that successively change is called Sere.

Diagrammatic Explanation →

MADHYA PRADESH BOARD OF SECONDARY EDUCATION, MADHYA PRADESH, BHOPAL

प्रश्न क्र.

### Ans. of Q. 19

→ Several steps for recombinant DNA Technology:-

- 1) Firstly, desired DNA called foreign DNA or target DNA or Alec DNA is selected → Isolation of whole DNA.
- 2) The DNA segment is treated with Restriction enzyme.
- 3) The foreign DNA segment is inserted into the suitable vector (such as pBR 322) → called Recombinant DNA.
- 4) The vector is inserted into host cell through the process such as Microinjection or gene gun.
- 5) Multiplication and copying is done by host cell by giving it suitable condition.
- 6) The product is separated from host cell.
- 7) Obtain desired product.

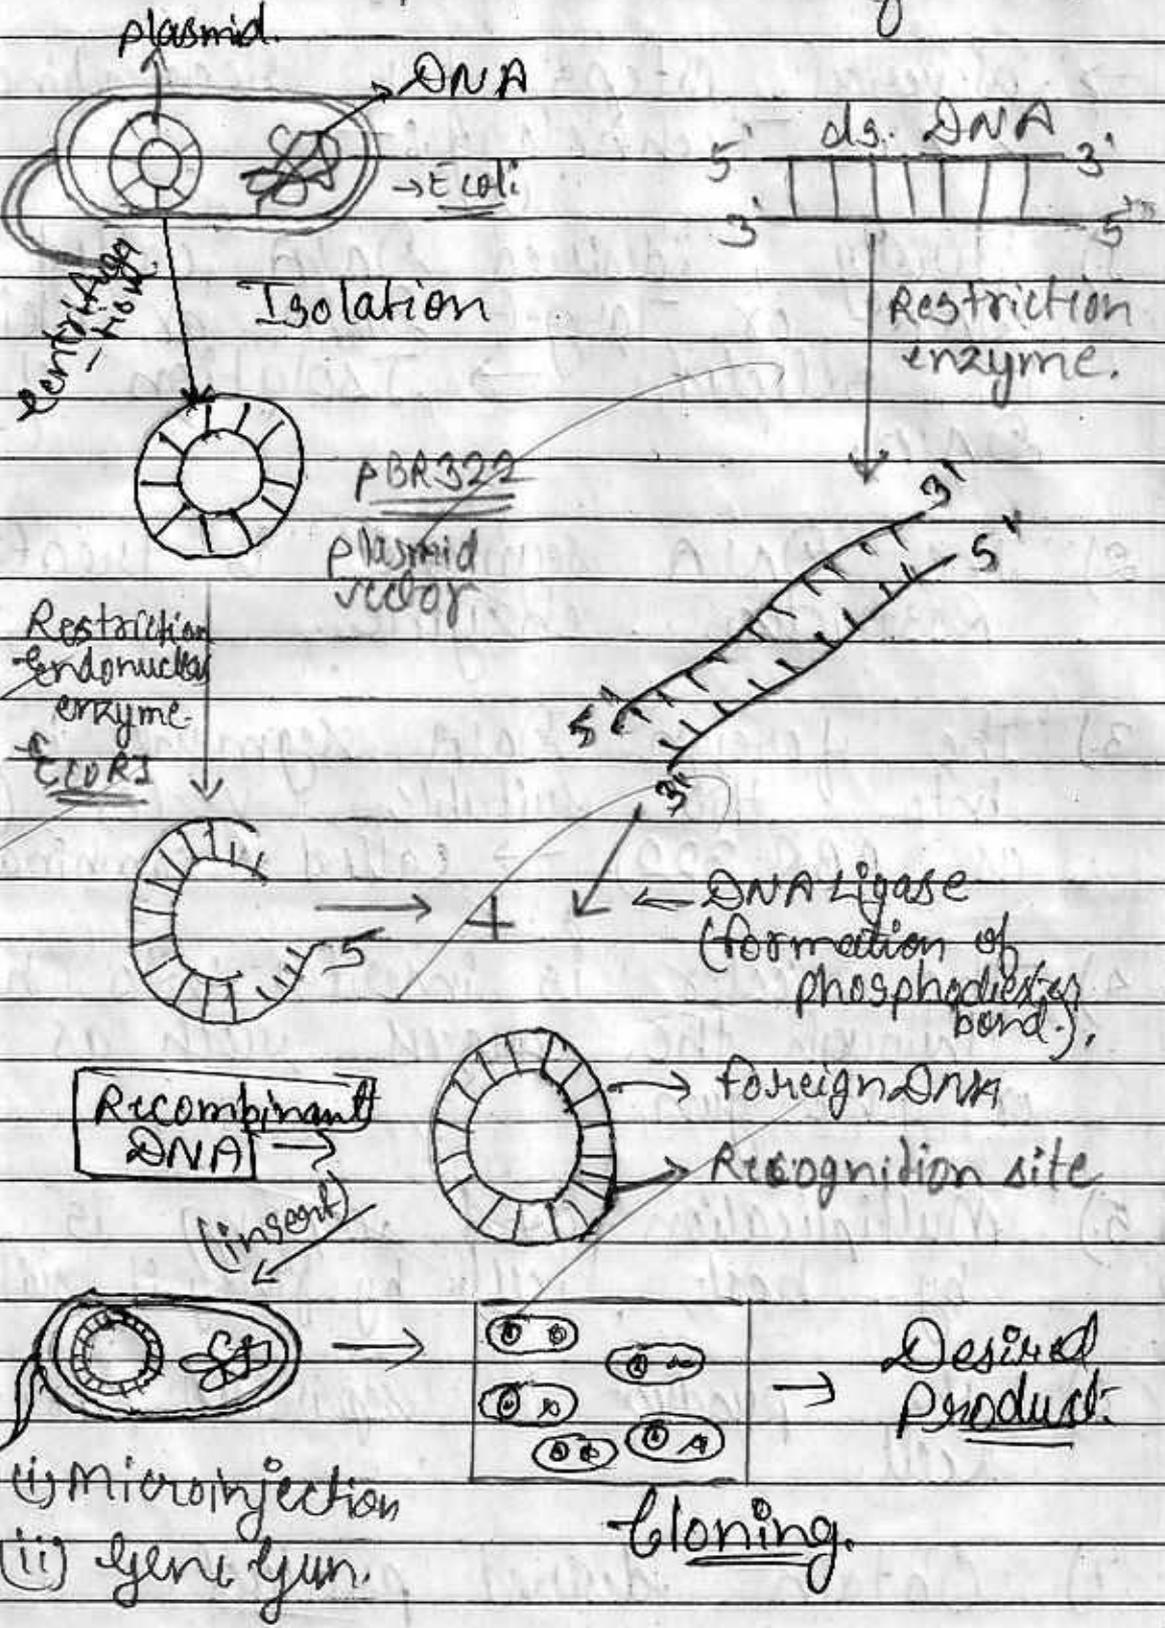

B  
S  
E
